

## **AD8402 -- ARTIFICIAL INTELLIGENCE I**

### **OBJECTIVES:**

The objective of this course is to enable the students to

- Understand the basic concepts of intelligent agents
- Develop general-purpose problem solving agents, logical reasoning agents, and agents that reason under uncertainty
- Employ AI techniques to solve some of today's real world problems.

### **UNIT I                      INTELLIGENT AGENTS**

Introduction to AI – Agents and Environments – Concept of rationality – Nature of environments – Structure of agents Problem solving agents – search algorithms – uninformed search strategies

### **UNIT II                      PROBLEM SOLVING**

Heuristic search strategies – heuristic functions Local search and optimization problems – local search in continuous space – search with non- deterministic actions – search in partially observable environments – online search agents and unknown environments

### **UNIT III                      GAME PLAYING AND CSP**

Game theory – optimal decisions in games – alpha-beta search – monte-carlo tree search – stochastic games – partially observable games Constraint satisfaction problems – constraint propagation – backtracking search for CSP – local search for CSP – structure of CSP

### **UNIT IV                      LOGICAL AGENTS**

Knowledge-based agents – propositional logic – propositional theorem proving – propositional model checking – agents based on propositional logic  
- First-order logic – syntax and semantics – knowledge representation and engineering – inferences in first-order logic – forward chaining – backward chaining -- resolution

### **UNIT V                      KNOWLEDGE REPRESENTATION AND PLANNING**

Ontological engineering – categories and objects – events – mental objects and modal logic – reasoning systems for categories – reasoning with default information - Classical planning – algorithms for classical planning heuristics for planning – hierarchical planning – non-deterministic domains – time, schedule, and resources – analysis

**COURSE OUTCOMES:**

**On successful completion of this course, the students will be able to**

1. Explain autonomous agents that make effective decisions in fully informed, partially observable, and adversarial settings
2. Choose appropriate algorithms for solving given AI problems
3. Design and implement logical reasoning agents
4. Design and implement agents that can reason under uncertainty

**TOTAL : 45 PERIODS**

# UNIT I

## INTELLIGENT AGENTS

Introduction to AI – Agents and Environments – Concept of rationality – Nature of environments – Structure of agents Problem solving agents – search algorithms – uninformed search strategies

### PART A

#### 1) What Are the Different Types of Intelligent Agents?

Simple reflex agent, **Model-based reflex agent, Goal-based agent, Utility-based agent, Learning agent**

#### 2) What Are Intelligent Agents Used For?

IAs can serve as automated online assistants that perceive customers' needs to provide personalized customer service. These agents typically have a dialog system, an avatar, and an expert system that serves specialized functions. They can also optimize coordination between human groups online. Examples, as mentioned above, include Alexa and Siri. A smart vacuum cleaner that cleans an area by moving from one tile to another is also an IA.

#### 3) What is An Intelligent Agent?

An intelligent agent (IA) is a computer software system that's capable of acting independently to achieve certain goals and responding to people or events that are happening around it. It is programmed using the field of artificial intelligence (AI) called "machine learning (ML)" and equipped with sensors that allow it to observe and adapt to situations.

#### 4) What Are the Characteristics of Agents?

. An agent is a computer software system whose main characteristics are situatedness, autonomy, adaptivity, and sociability.

#### 5) Define Rational Agent.

For each possible percept sequence, a rational agent should select an action that is expected to maximize its performance measure, given the evidence provided by the percept sequence and whatever built-in knowledge the agent has.

## 6) What is PEAS ? Explain with Example.

PEAS: Performance, Environment, Actuators, Sensors

Performance Measure	Environment	Actuators	Sensors
safe, fast, legal, comfortable trip, maximize profits	roads, other traffic, pedestrians, customers	steering, accelerator, brake, signal, horn, display	camera, sonar, speedometer, GPS, odometer, engine sensors, keyboard, accelerator

## 7) Explain Goal Based Agent .

Every IA has a set of goals to respond desirably to its situation. This kind of IA uses pre-programmed actions based on their possible outcomes to meet its objectives. It can perform a single or many activities, depending on its goal.

## 8) Explain the Structure of Intelligent Agents.

The IA structure consists of three main parts: architecture, agent function, and agent program.

1. Architecture: This refers to machinery or devices that consists of actuators and sensors. The intelligent agent executes on this machinery. Examples include a personal computer, a car, or a camera.
2. Agent function: This is a function in which actions are mapped from a certain percept sequence. Percept sequence refers to a history of what the intelligent agent has perceived.
3. Agent program: This is an implementation or execution of the agent function. The agent function is produced through the agent program's execution on the physical architecture.

## 9) State Weiss's Classification.

Logic-based agents – in which the decision about what action to perform is made via logical deduction;

Reactive agents – in which decision making is implemented in some form of direct mapping from situation to action;

Belief-desire-intention agents – in which decision making depends upon the manipulation of data structures representing the beliefs, desires, and intentions of the agent; and finally,

Layered architectures – in which decision making is realized via various software layers, each of which is more or less explicitly reasoning about the environment at different levels of abstraction.

## 10) Define Utility Based Agents.

They choose actions based on a preference (utility) for each state.

Goals are inadequate when –

- There are conflicting goals, out of which only few can be achieved.
- Goals have some uncertainty of being achieved and you need to weigh likelihood of success against the importance of a goal.

## 11) Name Two Applications Use PEAS Representation.

Example of Agents with their PEAS representation

Agent	Performance measure	Environment	Actuators	Sensors
1. Medical Diagnose	<ul style="list-style-type: none"> <li>◦ Healthy patient</li> <li>◦ Minimized cost</li> </ul>	<ul style="list-style-type: none"> <li>◦ Patient</li> <li>◦ Hospital</li> <li>◦ Staff</li> </ul>	<ul style="list-style-type: none"> <li>◦ Tests</li> <li>◦ Treatments</li> </ul>	Keyboard (Entry of symptoms)
2. Vacuum Cleaner	<ul style="list-style-type: none"> <li>◦ Cleanness</li> <li>◦ Efficiency</li> <li>◦ Battery life</li> <li>◦ Security</li> </ul>	<ul style="list-style-type: none"> <li>◦ Room</li> <li>◦ Table</li> <li>◦ Wood floor</li> <li>◦ Carpet</li> <li>◦ Various obstacles</li> </ul>	<ul style="list-style-type: none"> <li>◦ Wheels</li> <li>◦ Brushes</li> <li>◦ Vacuum Extractor</li> </ul>	<ul style="list-style-type: none"> <li>◦ Camera</li> <li>◦ Dirt detection sensor</li> <li>◦ Cliff sensor</li> <li>◦ Bump Sensor</li> <li>◦ Infrared Wall Sensor</li> </ul>

## 12) What Are The Properties of Environment.

Discrete / Continuous

Observable / Partially Observable

Static / Dynamic

Single agent / Multiple agents

Accessible / Inaccessible

Deterministic / Non-deterministic

Episodic / Non-episodic

### **13) What is The Role of Intelligent Agents?**

An intelligent agent is a program that can make decisions or perform a service based on its environment, user input and experiences. These programs can be used to autonomously gather information on a regular, programmed schedule or when prompted by the user in real time.

### **14) What are the Five Fundamental Traits of Intelligent Function?**

The top five characteristics of truly intelligent FS organisations, according to our research, are: living, enhanced, modular, liquid and human

### **15) Explain Sensors.**

Sensor is a device which detects the change in the environment and sends the information to other electronic devices. An agent observes its environment through sensors.

### **16) Explain Actuators.**

Actuators are the component of machines that converts energy into motion. The actuators are only responsible for moving and controlling a system. An actuator can be an electric motor, gears, rails, etc.

### **17) Explain Effectors.**

Effectors are the devices which affect the environment. Effectors can be legs, wheels, arms, fingers, wings, fins, and display screen.

### **18) What Are Four Main rules of Intelligent Agent?**

- Rule 1: An AI agent must have the ability to perceive the environment.
- Rule 2: The observation must be used to make decisions.
- Rule 3: Decision should result in an action.
- Rule 4: The action taken by an AI agent must be a rational action.

### **19) What is Learning Agent?**

A learning agent in AI is the type of agent that can learn from its past experiences or it has learning capabilities. It starts to act with basic knowledge and then is able to act and adapt.

A learning agent has mainly four conceptual components, which are:

Learning element: It is responsible for making improvements by learning from the environment

Critic: The learning element takes feedback from critics which describes how well the agent is doing with respect to a fixed performance standard.

Performance element: It is responsible for selecting external action

Problem Generator: This component is responsible for suggesting actions that will lead to new and informative experiences.

## **20) How PEAS works in a Self Driving Car?**

**Performance:** Safety, time, legal drive, comfort

**Environment:** Roads, other vehicles, road signs, pedestrian

**Actuators:** Steering, accelerator, brake, signal, horn

**Sensors:** Camera, GPS, speedometer, odometer, accelerometer, sonar.

## **PART B**

- 1) State and Explain the Types of Environments in AI.
- 2) Explain the Types Of Intelligent Agents.
- 3) Explain Rationality With Example.
- 4) Explain All Four Characteristics of Intelligent Agent.
- 5) List The Features of Intelligent Agents.

## **UNIT II-**

### **PROBLEM SOLVING**

Heuristic search strategies – heuristic functions Local search and optimization problems – local search in continuous space – search with nondeterministic actions – search in partially observable environments – online search agents and unknown environments

## **PART A**

### **1. What is heuristic search**

Heuristic search is a class of method which is used in order to search a solution space for an optimal solution for a problem. The heuristic here uses some method to search the solution space while assessing where in the space the solution is most likely to be and focusing the search on that area

### **Heuristic Function**

A heuristic function (algorithm) or simply a heuristic is a shortcut to solving a problem when there are no exact solutions for it or the time to obtain the solution is too long

## 2. Define Problem Formulation ?

- An important aspect of intelligence is goal-based problem solving.
- The solution of many problems can be described by finding a sequence of actions that lead to a desirable goal.
- Each action changes the state and the aim is to find the sequence of actions and states that lead from the initial (start) state to a final (goal) state.

## 3. What are the four components to define a problem ? Define them . Answer :

A problem is defined by four items:

**initial state** : e.g., "at Arad"

**successor function** :  $S(x)$  = set of action-state pairs e.g.,  $S(\text{Arad})$

= {[Arad -> Zerind; Zerind], ..... }

**goal test**, can be

explicit, e.g.,  $x = \text{at Bucharest}$

implicit, e.g.,  $\text{NoDirt}(x)$

**path cost** (additive) :

e.g., sum of distances, number of actions executed, etc.  $c(x; a; y)$

is the step cost, assumed to be  $\geq 0$

## 4. Define a graph and path.

A Graph is a non-linear data structure consisting of nodes and edges. The nodes are sometimes also referred to as vertices and the edges are lines or arcs that connect any two nodes in the graph

Path - sequence through state space

## 5. Discover what is optimal solution ?

An optimal solution is a feasible solution where the objective function reaches its maximum (or minimum) value – for example, the most profit or the least cost

explicit, e.g.,  $x = \text{at Bucharest}$

implicit, e.g.,  $\text{NoDirt}(x)$

**path cost** (additive) :

e.g., sum of distances, number of actions executed, etc.  $c(x; a; y)$  is

the step cost, assumed to be  $\geq 0$

## 6. Define a graph and path.

A Graph is a non-linear data structure consisting of nodes and edges. The nodes are sometimes also referred to as vertices and the edges are lines or arcs that connect any two nodes in the graph

Path - sequence through state space

## 7. Discover what is optimal solution?:

An optimal solution is a feasible solution where the objective function reaches its maximum (or minimum) value – for example, the most profit or the least cost

## 8. Define Abstraction.

Data Abstraction is defined as the process of reducing the object to its essence so that only the necessary characteristics are exposed to the users

## 9. Rank and list criteria to measure the performance of search strategies.

criteria for measuring the performance of uninformed search strategies

Criterion	Breadth-First	Uniform-Cost	Depth-First	Depth-Limited	Iterative Deepening	Bidirectional (if applicable)
Complete?	Yes <sup>a</sup>	Yes <sup>a,b</sup>	No	No	Yes <sup>a</sup>	Yes <sup>a,d</sup>
Time	$O(b^{d+1})$	$O(b^{1+\lceil C^*/\epsilon \rceil})$	$O(b^m)$	$O(b^l)$	$O(b^d)$	$O(b^{d/2})$
Space	$O(b^{d+1})$	$O(b^{1+\lceil C^*/\epsilon \rceil})$	$O(bm)$	$O(bl)$	$O(bd)$	$O(b^{d/2})$
Optimal?	Yes <sup>c</sup>	Yes	No	No	Yes <sup>c</sup>	Yes <sup>c,d</sup>

Evaluation of search strategies,  $b$  is the branching factor;  $d$  is the depth of the shallowest solution;  $m$  is the maximum depth of the search tree;  $l$  is the depth limit. Superscript caveats are as follows: <sup>a</sup> complete if  $b$  is finite; <sup>b</sup> complete if step costs  $\geq E$  for positive  $E$ ; <sup>c</sup> optimal if step costs are all identical; <sup>d</sup> if both directions use breadth-first search.

10. Differentiate uninformed search and informed search.

#### UNINFORMED SEARCH STRATEGIES :

Uninformed Search Strategies have no additional information about states beyond that provided in the problem definition.

Informed (Heuristic) Search Strategies :

- Informed search strategy is one that uses problem-specific knowledge beyond the definition of the problem itself
- It can find solutions more efficiently than uninformed strategy.

11. Examine the breadth first search.

Breadth-first search

- Breadth-first search is a simple strategy in which the root node is expanded first, then all successors of the root node are expanded next, then their successors, and so on.
- In general, all the nodes are expanded at a given depth in the search tree before any nodes at the next level are expanded.
- Breadth-first-search is implemented by calling TREE-SEARCH with an empty fringe that is a first-in-first-out (FIFO) queue, assuring that the nodes that are visited first will be expanded first.

Access the depth-limited search.

The problem of unbounded trees can be alleviated by supplying depth-first-search with a pre-determined depth limit  $l$ .

- That is nodes at depth  $l$  are treated as if they have no successors.
- This approach is called depth-limited-search.
- The depth limit solves the infinite path problem.

12. Summarize simulated annealing.

Simulated annealing is a method for solving unconstrained and bound-constrained optimization problems. The method models the physical process of heating a material and then slowly lowering the temperature to decrease defects, thus minimizing the system energy.

13. Summarize stochastic beam search. :

Stochastic Beam Search (SBS) is a simple search procedure that starts with a set of initial solutions and explores their neighborhood solutions using successor functions. It then keeps track of only the most promising (in terms of fitness)  $k$  solutions

14. Point out what is genetic algorithm.:

A genetic algorithm (GA) is a method for solving both constrained and unconstrained optimization problems based on a natural selection process that mimics biological evolution.

15. Compose what is best first search.

Best-first search

- Best-first search is an instance of general TREE-SEARCH or GRAPH-SEARCH algorithm in which a node is selected for expansion based on an evaluation function  $f(n)$ .
- The node with lowest evaluation is selected for expansion, because the evaluation measures the distance to the goal.

16. Analyse the definition of greedy best-first search.

Greedy Best-first search

- Greedy best-first search tries to expand the node that is closest to the goal, on the grounds that this is likely to a solution quickly.
- It evaluates the nodes by using the heuristic function  $f(n) = h(n)$ .

17. Point out and define node consistency, arc consistency and path consistency.

Node consistency :

Node consistency requires that every unary constraint on a variable is satisfied by all values in the domain of the variable, and vice versa. This condition can be trivially enforced by reducing the domain of each variable to the values that satisfy all unary constraints on that variable.

Arc consistency :

One method of constraint propagation is to enforce arc consistency

- Stronger than forward checking
- Fast

Arc refers to a directed arc in the constraint graph

Path consistency :

Path consistency is a property similar to arc consistency, but considers pairs of variables instead of only one. A pair of variables is path-

consistent with a third variable if each consistent evaluation of the pair can be extended to the other variable in such a way that all binary constraints are satisfied.

18. Define Admissible heuristic  $h(n)$ .

In A\* search, if it is optimal then,  $h(n)$  is an admissible heuristic which means  $h(n)$  never overestimates the cost to reach the goal.

19. What are the 2 types of memory bounded heuristic algorithms?

Recursive Best First  
Search (RBFS) Memory  
bounded A\* (MA\*)

20. Differentiate BFS & DFS

BFS means breadth wise search. Space complexity is more. Do not give optimal solution. Queuing fn is same as that of queue operator.

DFS means depth wise search. Space complexity is less. Gives optimal solution. Queuing fn is somewhat different from queue operator.

21. What is RBFS?

It keeps track of the f-value of the best alternative path available from any ancestor of the current node. RBFS remembers the f-value of the best leaf in the forgotten sub tree and therefore decide whether its worth re expanding the sub tree sometimes later.

## PART B

1. Discuss about

- i. Greedy best-first search.
- ii. A\* search
- iii. Memory bounded heuristic search.

2. Summarize the following uninformed

- i. Depth first search
- ii. Iterative deepening depth first search.
- iii. Bidirectional search.

3.

- i. Explain in detail about models for predicate logic.
- ii. Explain assertions and queries in first-order logic.

4. Relate first order logic with proposition logic and discuss in detail about the same

5.

- i. Compose what is uninformed search? explain depth first search with example.
- ii. Compose the algorithm for recursive best first search.

6.
  - i. Explain the nature of heuristics with an example. What is the effect of heuristics accuracy on performance?
  - ii. Write a simple back tracking algorithm for constraint satisfaction problems.
7. Explain briefly about problem solving strategies.
8. Describe Alpha Beta pruning with Algorithm.
9. Explain stochastic games with examples
10. Show and explain optimization problems

## UNIT III

### GAME PLAYING AND CSP

Game theory – optimal decisions in games – alpha-beta search – monte-carlo tree search – stochastic games – partially observable games Constraint satisfaction problems – constraint propagation – backtracking search for CSP – local search for CSP – structure of CSP

#### PART A

##### 1. What is game playing in AI?

General game playing (GGP) is the design of artificial intelligence programs to be able to play more than one game successfully. For instance, a chess-playing computer program cannot play checkers. General game playing is considered as a necessary milestone on the way to artificial general intelligence. Gameplay is the specific way in which players interact with a game, and in particular with video games. Gameplay is the pattern defined through the game rules, connection between player and the game, challenges and overcoming them, plot and player's connection with it.

##### 2. What is game theory in artificial intelligence?

Game Theory is a branch of mathematics used to model the strategic interaction between different players in a context with predefined rules and outcomes. Game Theory can be applied in different ambit of Artificial Intelligence: Multi-agent AI systems.

#### Imitation and Reinforcement Learning

##### 3. Where is game theory used in AI?

Currently, game theory is being used in adversary training in GANs, multi-agent systems, and imitation and reinforcement learning. In the case of perfect information and symmetric games, many Machine Learning and Deep Learning techniques are applicable.

##### 4. What are the characteristics of game theory?

Game theory, branch of applied mathematics that provides tools for analyzing situations in which parties, called players, make decisions that are interdependent. This interdependence causes each player to consider the other player's possible decisions, or strategies, in formulating strategy.

##### 5. What is optimal decision gaming?

In a normal search problem, the optimal solution would be a sequence of actions leading to a goal state—a terminal state that is a win. An optimal decision is a decision that leads to at least as good a known or expected outcome as all other available decision options.

In practice, few people verify that their decisions are optimal, but instead use heuristics to make decisions that are "good enough"—that is, they engage in satisficing.

## **6. How are optimal decisions made?**

To make an optimal decision, economists ask: “What are the extra (marginal) costs and what are the extra (marginal) benefits associated with the decision. If the extra benefits are bigger than the extra costs, you shall go ahead with the decision, namely the decision is good.

## **7. What is Alpha Beta algorithm in artificial intelligence?**

Alpha-beta pruning is a modified version of the minimax algorithm. It is an optimization technique for the minimax algorithm.

It is also called as Alpha-Beta Algorithm. Alpha-beta pruning can be applied at any depth of a tree, and sometimes it not only prune the tree leaves but also entire sub-tree.

## **8. What is alpha-beta pruning?**

Alpha Beta Pruning is a method that optimizes the Minimax algorithm. The number of states to be visited by the minimax algorithm are exponential, which shoots up the time complexity. Some of the branches of the decision tree are useless, and the same result can be achieved if they were never visited.

## **9. What is Monte Carlo tree search used for?**

In computer science, Monte Carlo tree search (MCTS) is a heuristic search algorithm for some kinds of decision processes, most notably those employed in software that plays board games. In that context MCTS is used to solve the game tree. MCTS was combined with neural networks in 2016 for computer .

## **10. What are the four steps of Monte Carlo tree search?**

The process of Monte Carlo Tree Search can be broken down into four distinct steps, selection, expansion, simulation and back propagation.

## **11. What are the advantages of Monte Carlo search?**

### **Advantages :**

MCTS is a simple algorithm to implement.

Monte Carlo Tree Search is a heuristic algorithm. MCTS can operate effectively without any knowledge in the particular domain, apart from the rules and end conditions and can find its own moves and learn from them by playing random play outs.

## **12. What are stochastic games in detail?**

A stochastic game was introduced by Lloyd Shapley in the early 1950s. It is a dynamic game with probabilistic transitions played by one or more players.

The game is played in a sequence of stages. At the beginning of each stage, the game is in a certain state.

Stochastic games (SG) - also called Markov games - extend Markov decision process (MDP) to the case where there are multiple players in a common environment.

These agents perform a joint action that defines both the reward obtained by the agents and the new state of the environment.

### **13. What is partial observability in AI?**

Partial observability means that an agent does not know the state of the world or that the agents act simultaneously. In a partially observable system the observer may utilize a memory system in order to add information to the observer's understanding of the system. An example of a partially observable system would be a card game in which some of the cards are discarded into a pile face down

### **14. What is CSP in artificial intelligence?**

A constraint satisfaction problem (CSP) consists of. a set of variables, a domain for each variable, and. a set of constraints.

### **15. What is CSP algorithm?**

In general, a CSP is a problem composed of a finite set of variables, each of which has a finite domain of values, and a set of constraints. The task is to find an assignment of a value for each variable such that the assignments satisfy all the constraints. In some problems, the goals are to find all such assignments.

### **16. What is an example of CSP?**

Some of the popular CSP problems include Sudoku, Cryptarithmic, crosswords, n-Queen, etc.

### **17. What is constraint propagation?**

Constraint propagation is the process of communicating the domain reduction of a decision variable to all of the constraints that are stated over this variable. This process can result in more domain reductions. These domain reductions, in turn, are communicated to the appropriate constraints.

### **18. How are constraints propagated in forward checking?**

Forward checking detects the inconsistency earlier than simple backtracking and thus it allows branches of the search tree that will lead to failure to be pruned earlier than with simple backtracking. This reduces the search tree and (hopefully) the overall amount of work done.

### **19. What is backtracking search with example?**

A depth-first search that chooses values for one variable at a time and backtracks when a variable has no legal values left to assign. Backtracking algorithm repeatedly chooses an unassigned variable, and then tries all values in the domain of that variable in turn, trying to find a solution. Examples where backtracking can be used to solve puzzles or problems include: Puzzles such as eight queens puzzle, crosswords, verbal arithmetic, Sudoku, and Peg Solitaire. Combinatorial optimization problems such as parsing and the knapsack problem.

### **20. Which search method is used in backtracking? depth-first search method**

In order to find these solutions, a search tree named state-space tree is used. In a state-space tree, each branch is a variable, and each level represents a solution. A backtracking algorithm uses the depth-first search method.

### **21. What is local search for CSP?**

A local search problem consists of a: CSP: a set of variables, domains for these variables, and constraints on their joint values. A node in the search space will be a complete assignment to all of the variables. local search is an incomplete method for finding a solution to a problem. It is based on iteratively improving an assignment of the variables until all constraints are satisfied. In particular, local search algorithms typically modify the value of a variable in an assignment at each step.

## **PART B**

1. What is the basic strategy in game playing in artificial intelligence?
2. Why is game theory important in AI?
3. Define Minimax Algorithm in Game Theory? 4. How does Monte Carlo tree search work?
5. How CSP is formulated as a search problem? 6. What is backtracking search in CSP?

## UNIT IV - LOGICAL AGENTS

Knowledge-based agents – propositional logic – propositional theorem proving – propositional model checking – agents based on propositional logic First-order logic – syntax and semantics – knowledge representation and engineering – inferences in first-order logic – forward chaining – backward chaining – resolution

### PART A

#### 1. What is first-order logic?

First-order logic is also known as Predicate logic or First-order predicate logic. First-order logic is a powerful language that develops information about the objects in a more easy way and can also express the relationship between those objects.

#### 2. What are the elements and symbols of First order logic?

3.

Following are the basic elements of FOL syntax:

Constant	1, 2, A, John, Mumbai, cat,....
Variables	x, y, z, a, b,....
Predicates	Brother, Father, >,....
Function	sqrt, LeftLegOf, ....
Connectives	$\wedge$ , $\vee$ , $\neg$ , $\Rightarrow$ , $\Leftrightarrow$
Equality	$=$
Quantifier	$\forall$ , $\exists$

#### 4. What are the three families of First-order inference algorithms?

Forward chaining and its applications to deductive database and production systems  
Backward chaining and logic programming systems  
Resolution-based theorem- proving system

#### 5. What are the parts of knowledge in first-order logic?

Approval Publish requests approval from a manager of the knowledge base before moving the article to the published state.  
Approval retire requests approval from a manager of knowledge base before moving the article to the retired state.

#### 6. Define terms.

Term = logical expression that refers to an object.

There are 2 kinds of terms:  
constant symbols: Table, Computer  
function symbols: LeftLeg(Pete), Sqrt(3), Plus(2,3) etc

## **7. Define the first order definite clause.**

They are called definite clause grammars because they represent a grammar as a set of definite clauses in first-order logic. The term DCG refers to the specific type of expression in Prolog and other similar languages; not all ways of expressing grammars using definite clauses are considered DCGs.

## **8. Define description logics.**

A description logic is used to describe classes, properties, and individuals. One of the main ideas behind a description logic is to separate a terminological knowledge base that describes the terminology, which should remain constant as the domain being modeled changes, and an assertional knowledge base that describes what is true in some domain at some point in time.

## **9. What is data-driven search? (forward chaining)**

Forward chaining is the logical process of inferring unknown truths from known data and moving forward using determined conditions and rules to find a solution. The opposite of forward chaining is backward chaining.

## **10. Define complex sentences**

Complex sentences are made by combining atomic sentences using connectives.

## **11. Show what is Skolemization?**

Skolemization in Artificial Intelligence is a procedure used when there is a requirement of the reduction of any first-order formula to its Skolem normal form. This is usually done when there is a need for proving a theorem by using programming.

## **12. Define Purely Reactive Agents.**

Reactive agents are software agents that carry out a simple task of retrieving pre-set behaviors similar to reflexes. It do not maintain the internal state, unlike deliberative agents. Finding a difference between reactive agents and deliberative agents can be indistinct though. It can simply be said that an agent that has no internal state is a reactive agent.

## **13. Explore some interesting properties of agents and perception.**

Behavior of Agent – It is the action that agent performs after any given sequence of percepts.

Percept – It is agent's perceptual inputs at a given instance.

#### **14. What are classes of agents?**

Simple Reflex Agent  
Model-based reflex agent  
Goal-based agents  
Utility-based agent  
Learning agent

#### **15. What are logical formulae and logical deduction?**

The phenomenon of deriving a conclusion from a single proposition or a set of given propositions, is known as logical deduction. The given propositions are also referred as the premises.

#### **16. Define Agent Communication.**

Agent communication is based on message passing, where agents communicate by formulating and sending individual messages to each other. The FIPA ACL specifies a standard message language by setting out the encoding, semantics and pragmatics of the messages.

#### **17. Define Coherence.**

Coherence arguments say that if an entity's preferences do not adhere to the axioms of expected utility theory, then that entity is susceptible to losing things that it values. This does not imply that advanced AI systems must adhere to these axioms ('be coherent'), or that they must be goal-directed.

#### **18. Define belief-desire-intention (BDI) architectures**

The belief–desire–intention software model (BDI) is a software model developed for programming intelligent agents. Superficially characterized by the implementation of an agent's beliefs, desires and intentions, it actually uses these concepts to solve a particular problem in agent programming.

#### **19. What are the fields Used in protocol?**

Routing Protocol.  
Open Shortest Path First.  
Transmission Control Protocol.  
User Datagram Protocol.

#### **20. What are the two types of control flow within layered architectures?**

Open layers  
Request flow.

**21. State the advantage of horizontal layered architectures.**

The advantage of horizontal layer architecture is that only  $n$  layers are required for mapping to  $n$  different types of behaviours. However, a mediator function is used to control the inconsistent actions between layer interactions.

**PART B**

1. Explain the inference process in first order logic, using suitable example Prolog Programming.
2. (i). Discuss backward chaining algorithm.(6)  
(ii).Explain the algorithm for computing more general unifiers.(7)
3. Explain the unification algorithm used for reasoning under predicate logic with an example.
4. Define Agent Communication. Write a short note on coordination, Dimensions of meaning and Message types.
5. Examine the Argumentation among Agents.

## UNIT V

### KNOWLEDGE REPRESENTATION AND PLANNING

Ontological engineering – categories and objects – events – mental objects and modal logic – reasoning systems for categories – reasoning with default information Classical planning – algorithms for classical planning – heuristics for planning – hierarchical planning – non-deterministic domains – time, schedule, and resources – analysis

#### PART A

##### 1. Define Ontological Engineering.

ontology engineering is a field which studies the methods and methodologies for building ontologies, which encompasses a representation, formal naming and definition of the categories, properties and relations between the concepts, data and entities.

##### 2. Explain Classical Planning with appropriate example.

Classical Planning is the planning where an agent takes advantage of the problem structure to construct complex plans of an action.

Example : Air cargo transport

Step 01 : Load: This action is taken to load cargo.

Step 02 : Unload: This action is taken to unload the cargo when it reaches its destination.

Step 03 : Fly: This action is taken to fly from one place to another.

##### 3. What are the features of an ideal planner?

- i. The planner should be able to represent the states, goals and actions.
- ii. The planner should be able to add new actions at any time.
- iii. The planner should be able to use Divide and Conquer method for solving very big problems.

##### 4. Define a complete plan, consistent plan. conditional planning.

A complete plan is one in which every precondition of every step is achieved by some other step.

A consistent plan is one in which there are no contradictions in the ordering or binding constraints.

Conditional planning is a way in which the incompleteness of information is incorporated in terms of adding a conditional step, which involves if – then rules.

**5. Give the classification of learning process.**

The learning process can be classified as:

Process which is based on coupling new information to previously acquired knowledge

- a. Learning by analyzing differences.
- b. Learning by managing models.
- c. Learning by correcting mistakes.
- d. Learning by explaining experience.
- e.

Process which is based on digging useful regularity out of data, usually called as Data base mining:

- a. Learning by recording cases.
- b. Learning by building identification trees.
- c. Learning by training neural networks.

**6. What are the processes of Relative clause.**

- i. Generating Good English sentences
- ii. Over generation
- iii. Under generation

**7. List the advantages of Classical Planning?**

- 1. It has provided the facility to develop accurate domain-independent heuristics
- 2. The systems are easy to understand and work efficiently.

**8. What is the use of Heuristics in Planning ?**

The heuristic function is a way to inform the search about the direction to a goal. It provides an informed way to guess which neighbor of a node will lead to a goal.

**9. Define Hierarchical planning.**

Hierarchical planning is a planning method based on Hierarchical Task Network (HTN) or HTN planning. It combines ideas from Partial Order Planning & HTN Planning.

**10. List the Advantages and Disadvantages of Hierarchical planning.**

**Advantages:**

1. The key benefit of hierarchical structure is that, at each level of the hierarchy, plan is reduced to a small number of activities at the next lower level, so the computational cost of finding the correct way to arrange those activities for the current problem is small.
2. For complex problems hierarchical planning is much more efficient than single level planning.

**Disadvantages :**

1. Many of the HTN planners require a Deterministic environment.
2. Many of the HTN planners are unable to handle uncertain outcomes of actions.

**11. Define DCG.**

The method of rewriting the existing rules in the grammar by the method of augmentation is called as DCG (Define Clause Grammar).

**12. What are the different types of planning?**

The different types of planning are,

- a. Situation space planning.
- b. Progressive planning.
- c. Regressive planning.
- d. Partial order planning and
- e. Fully instantiated planning.

**13. State the wait and see principle also the principle of No altering.**

**Wait and see principle :**

The law states that, “When there is doubt about what to do, do nothing”.

**No altering principle :**

The law states that, “ When an object or situation known to be an example, fails to match a general

Model, create a special case exception model”.

**14. What are the different types of entities in Ontological Engineering ?**

physical objects,

1. abstract objects,
2. time,
3. locations,
4. actions,

5. events,
6. beliefs.

**15 .What are the features of an ideal planner?**

1. planner should be able to represent the states, goals and actions.
2. planner should be able to add new actions at any time.
3. The planner should be able to use Divide and Conquer method for solving very big problems.

**16. What are the 3 mechanism to achieve performance improvement?**

- i. Relevance feedback
- ii. Document classification
- iii. Document clustering

**17.What are the types of clustering technique?**

- iv. Agglomerative clustering
- v. K-means clustering

**18.Define Information Extraction.**

It is a process of creating database entries by skimming a text and looking for occurrences of a particular class of object.

**19.What are the types of information extraction systems?**

- a. Attribute based system
- b. Relational based system

**20. How to use the parameters for machine translation?**

- a. Segment into sentences
- b. Estimate the French language model
- c. Align sentences
- d. Estimate the initial fertility model
- e. Estimate the initial word choice model
- f. Estimate the initial offset model
- g. Improve all the estimates.:

## **PART B**

- 1.** List the Issues in knowledge representation.
- 2.** Explain about Hierarchical planning method with example?
- 3.** Explain different approaches of knowledge representation
- 4.** Explain how Bayesian network is used for representing knowledge in an Uncertain domain.
- 5.** Briefly explain the advanced plan generation systems. Describe hierarchical planning methods with an example
